## Abstract

The Hadwiger number of a graph  $G$  is the largest integer  $h$  such that  $G$  has the complete graph  $K_h$  as a minor. We show that the problem of determining the Hadwiger number of a graph is NP-hard on co-bipartite graphs, but can be solved in polynomial time on cographs and on bipartite permutation graphs. We also consider a natural generalization of this problem that asks for the largest integer  $h$  such that  $G$  has a minor with  $h$  vertices and diameter at most  $s$ . We show that this problem can be solved in polynomial time on AT-free graphs when  $s > 1$ , but is NP-hard on chordal graphs for every fixed  $s > 1$ .
